

Simple and efficient device management solution

Device Manager Platform

· MQTT Access

· Massive Devices

· RESTful API

· Secure Encryption

1. Product Overview

Device Manager is a next-generation IoT device management cloud platform independently developed and operated by InHand Networks. Through a visual user interface and simple workflows, the Device Manager platform enables users to conveniently manage and monitor InHand hardware devices such as routers and gateways, achieve rapid device integration, and perform one-click management of massive device fleets. Cloud deployment provides an easy "use-and-go" experience, allowing users to focus on core business and empowering enterprise growth.

Core Value

- **Rich Device Management:** Device Manager provides rich capabilities suitable for a wide range of industry scenarios.
- **Worldwide Remote Management:** Manage InHand hardware devices distributed globally without leaving your office, saving time and effort.
- **Multi-Role Permission Control:** Allows IT and OT teams to collaborate efficiently from anywhere.
- **MQTT Protocol Access:** Technical architecture supports MQTT for broad IoT applications.
- **Low-Bandwidth & Massive Scale:** Suitable for field environments with low bandwidth and high latency; supports massive device access and cloud-based management.
- **RESTful API Integration:** Provides RESTful API interfaces for secondary development and rapid integration with other service systems.
- **End-to-End Security:** CA certification, data encryption, user authentication, and access control, together with multiple integrated security mechanisms on both platform and devices, ensure network and data transmission security.

2. Software Specifications

Category/Parameter	Specification
Device Management	
Information Management	Device serial number, model, firmware version, configuration status, signal strength, IMSI, IMEI, ICCID, etc.
Configuration Update	Batch remote configuration, task distribution management, and remote device reboot control
Firmware Upgrade	Batch firmware upgrades and upgrade task management
Remote Web	Remote access to routers and remote router configuration modification
Edge Computing	Edge SDK installation, edge application installation, and remote updates of application configurations
Log Viewing	View device logs
Device Monitoring	
Statistical Analysis	Device traffic usage analysis, device online status analysis, and multi-dimensional cellular signal quality analysis
Event Alerts	Alert push for device online/offline events, traffic alarms, dual-SIM switching, link backup, and port status events
GIS Map	Manage and track device locations
Task Tracking	Manage system runtime tasks of all devices and track task status and progress online

Category/Parameter	Specification
Group Management	Group and manage devices on demand
System Management	
User Management	Manage system user accounts and support multi-user device management
Permission Management	Customize user device permissions for secure device management
Integration Services	Rapid integration with third-party services
System Settings	Personal information settings
System Logs	Online tracking of system logs

3. Compatible Hardware Products

- Supports access to InHand InRouter200, InRouter300, InRouter600, InRouter900, InGateway101, InGateway500, InGateway900, InVehicle G710, and InVehicle G814 series products.
- Access scale: 400,000+
