InHand Networks

IoT Device Management and Operations Platform

DeviceLive

- Device Management
- Remote Monitoring
- Edge Computing
- Remote Maintenance

1. Product Overview

DeviceLive is an industrial IoT device management and operations platform. Combined with InHand edge intelligence hardware, it helps industrial enterprises rapidly build smart edge networks. The platform provides four core capabilities: **device management, remote monitoring, edge computing application management, and remote terminal maintenance**. Through cloud-edge collaboration, it enables intelligent edge deployment and upgrades, edge data collection and preprocessing, and visualized status monitoring.

The rapid development of IoT has brought massive numbers of devices and business data. To address digitalization challenges, industrial sectors apply digital and information technologies to achieve **IT/OT convergence**, improving production efficiency, optimizing processes, and enhancing product quality.

Core Value

Real-Time Monitoring and Remote Control: DeviceLive enables real-time monitoring of device status and operation, and supports remote control (such as parameter adjustment and device reboot), improving device reliability and production efficiency.

Fault Prediction and Maintenance Optimization: Potential faults can be identified through operational data monitoring, enabling proactive maintenance and reducing downtime and production line interruptions.

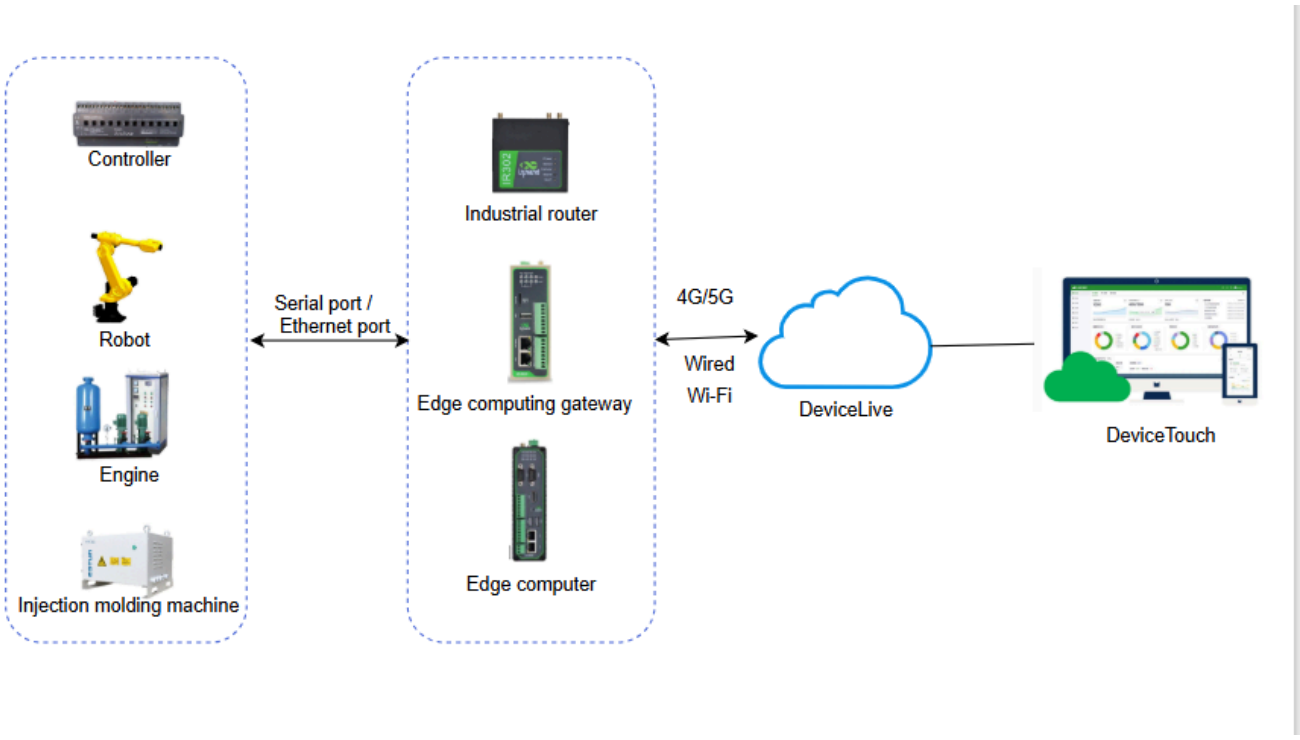

Data Analysis and Decision Optimization: In-depth analysis of device data provides insights into production processes, optimizes planning and workflows, reduces waste, and improves quality.

Enhanced Customer Experience: Supports preventive maintenance, intelligent repair, and fast response to improve customer satisfaction and loyalty.

2. Platform Capability Overview

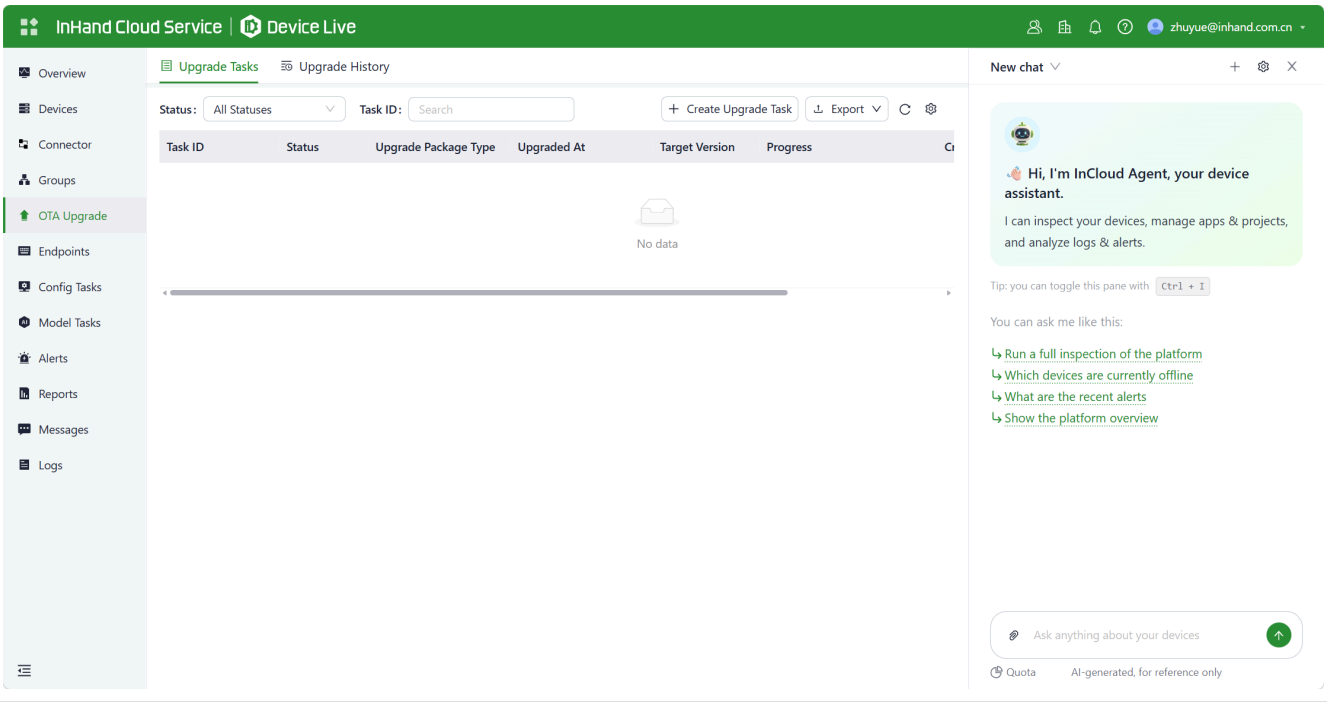

DeviceLive provides four core capabilities: **device management, network monitoring, edge computing application management, and remote terminal maintenance**. With cloud-edge collaboration, it enables intelligent edge deployment and upgrades, edge data collection and preprocessing, and visualized status monitoring, comprehensively improving management efficiency.

Remote Terminal Access Control

DeviceLive supports engineers in remotely accessing terminal devices connected downstream of routers, enabling remote terminal maintenance and program deployment, while establishing transmission channels for continuous terminal data reporting to business centers. It is suitable for distributed terminal access scenarios and supports Ethernet terminal access for industrial PCs, servers, cameras, PLCs, HMIs, controllers, and more.

Edge Computing Application Management

For edge intelligence hardware products, DeviceLive provides management and deployment of edge computing container applications and native applications, without requiring users to build their own OTA services, delivering a one-stop solution.

DeviceLive can centrally configure edge intelligence hardware, manage containers, and upgrade edge computing apps. It supports unified deployment package strategies and rule definitions, enabling centralized upgrades and control of distributed intelligent sites.

Zero-Touch Deployment and O&M Features

Capability	Description
Plug-and-Play Devices	Complete configuration and deployment remotely from the cloud
Simple Configuration	Web GUI configuration without complex CLI commands
Centralized Cloud Management	Unified device management with batch configuration and upgrades
Fault Warning and Remote Diagnostics	Multiple alert strategies and remote diagnostics for time-saving troubleshooting
Multi-Dimensional Security Policies	Data encryption, multi-role permissions, and multi-factor authentication
Visualized Monitoring	Comprehensive insights into connection status, network quality, cellular signal, and more

3. Edge Intelligence Hardware and Cloud Data Integration

Multi-Function Edge Hardware

- Multiple **CPU** options: from single-core to multi-core ARM processors
- Multiple **AI computing power** options: approximately 1-26 TOPS, suitable for edge AI scenarios such as facial recognition, speech recognition, and image recognition
- Multiple **interfaces**: Ethernet, serial, USB, IO, CAN, HDMI, LVDS, etc.

Distribution Linux and Secondary Development

- Edge intelligence products are built on **distribution Linux**, providing a standard software development environment
- Supports high-level programming languages and Linux community resources to improve development efficiency

DeviceSupervisor™ Agent

- InHand **DeviceSupervisor™ Agent** is built in at factory delivery. No programming is required; simple configuration enables **data-to-cloud**
- Supports local data preprocessing to reduce upload traffic and cloud load
- Supports mainstream industrial protocols (such as Modbus, OPC UA, ISO on TCP, etc.)
- Supports integration with major public clouds and IoT cloud platforms, including **AWS, Microsoft Azure, and Alibaba Cloud**

4. Application Scenarios

InHand edge intelligence solutions integrate 5G, AI, IoT, and cloud computing, and can be used in **public utility digitalization, predictive equipment maintenance, new energy digitalization, and factory digitalization**.

Domain	Description
Industrial IoT (IIoT)	Real-time monitoring of device status to improve production efficiency; predictive maintenance to reduce fault risks
Smart City	Smart traffic management and urban digital applications to improve governance efficiency
Healthcare	Improved service accessibility with real-time patient status monitoring
Energy Management	Improved energy utilization efficiency, optimized consumption, and reduced waste

5. License Specifications

Module	Feature	DeviceLive Basic Plan	DeviceLive Edge Professional Plan
Device Management	Remote Configuration	√	√
	Firmware Upgrade	√	√
	Remote Reboot	√	√
	Remote Factory Reset	√	√
	Batch Management	√	√
	DeviceSupervisor Management	√	√
	OTA Upgrade	√	√
Device Monitoring	Online/Offline	√	√
	Interface Status	√	√
	Cellular Signal	√	√
	Traffic Statistics	√	√
	Performance Status	√	√
	Geolocation	√	√
	Alerts	√	√
Remote Endpoint Maintenance	Connector	×	√
	DeviceTouch	√	√
Project & Application Management	Project Version Management	×	√
	Environment Incremental Package Management	×	√
	Application Management	×	√

Module	Feature	DeviceLive Basic Plan	DeviceLive Edge Professional Plan
Remote O&M and Diagnostics	Remote Access	√	√
	Ping	√	√
	Traceroute	√	√
	Packet Capture	√	√
	Log Download	√	√

Key Notes

- **1. The DeviceLive Basic Plan is free of charge.**

  Connecting devices, monitoring them, and day-to-day remote management require no license purchase.

- **2. New devices include three months of DeviceLive Edge Professional Plan.**

  The first time a device is added to DeviceLive, a three-month Pro license is issued automatically — no request and no payment required. When the term ends, the device continues to run on the Basic plan with full access to all basic features.
